Testovex

PLATFORM OVERVIEW

Cut test maintenance. Raise quality. Ship faster.

Testovex is a no-code test automation platform with agents that own the quality work. They write the tests, explain every failure, fix what breaks, file the bug and tell you if you are ready to release, so your team spends its time on quality, not upkeep.

Lower maintenance cost

Tests that repair themselves and are fixed once, for every project.

Higher quality

More coverage, trusted results and release decisions backed by evidence.

Higher productivity

Tests in minutes, failures explained, bugs drafted and no manual status.

- Web and API in one test case
- Tests generated in minutes
- Agents that ask before they act
- Live leadership views, no manual status

THE PROBLEM

Every QA team recognises this

Tests break every sprint

A renamed class or moved button turns dozens of tests red, though nothing is wrong with the product.

Web and API tested separately

The same flow lives in two tools and two suites, so effort is duplicated and gaps appear between them.

Nobody knows why a run failed

The first hour goes on working out if it is a bug, a changed element, a slow page or a down environment.

Coverage falls behind releases

New stories ship faster than tests get written, so what is live is not what is covered.

Leaders fly blind

Results sit in many tools, status is compiled by hand, and "are we ready to ship?" is answered by gut feel.

THE BUSINESS IMPACT

What Testovex changes for your business

Lower cost

Less time lost to maintenance

- Self-Healing proposes the fix when a locator breaks, and Autofix verifies it
- Org library: build a component once, every test using it inherits the fix
- Failure Triage names the cause, so debugging takes minutes
- No-code recorder: analysts build tests, not only specialist engineers

Higher quality

Fewer defects reach customers

- Test Author drafts tests from Jira stories and API specs, so coverage keeps pace
- Web and API in one test case closes the gap between layers
- Flaky detection means a red build is real again
- Release Readiness gives a ready, at risk or not ready verdict with evidence

Higher productivity

More done with the same team

- Tests generated in minutes, run in parallel across three browsers
- Bug Reporter drafts the Jira bug with evidence attached
- Agent Inbox puts every decision in one place
- Leadership dashboards replace manual status reports

BEFORE AND AFTER

Where your QA hours go today, and where they go with Testovex

Activity	Today	With Testovex
Repairing tests after UI changes	Hours of manual locator fixes every sprint	**Fix proposed from the live page and verified**
Finding why a run failed	Digging through logs and videos	**Cause named on every failure**
Covering new stories	Tests written by hand, often late	**Drafts in minutes from Jira and specs**
Logging defects	Copying evidence into Jira by hand	**Bug drafted for one-click approval**
Reporting to leadership	Spreadsheets and status meetings	**Live dashboards by org, project, release**
The release decision	Gut feel	**Ready, at risk or not ready, with evidence**

A simple way to size it. Take a team of 5 QA engineers. If 30% of their time goes on test upkeep and failure triage, that is 1.5 engineers of capacity. Cutting that by even one third gives back half an engineer, every month, to spend on new coverage. Plug in your own numbers in the ROI calculator at **testovex.com/pricing**. (Illustrative example, not a guarantee. Results depend on your team and application.)

WHY TESTOVEX

The highlights, at a glance

Agents work through the whole pipeline, from writing a test to the release decision, and a person approves every change that matters.

Test Author	Run	Failure Triage	Self-Healing	Bug Reporter	Release Readiness
drafts tests	every change	explains why	fixes tests	drafts Jira bugs	go / no-go

Agents for the end-to-end pipeline

A team of agents covers create, run, understand, fix, report and decide. Also Flaky detection, Environment Doctor, Agent Inbox, Agents Live and Ask Your Tests. **Agents suggest, you approve.**

Web and API in one test case

One test covers the flow from the screen to the API behind it. No separate tools, no duplicate suites, no gaps between them.

Org library for all projects

Build a component once, get it reviewed and approved, and reuse it across every project. Fix it once and every test using it inherits the fix. **Consistent, governed, faster.**

Leadership view dashboards

Live views by organization, project and release: readiness, governance, pass rate, failure causes and hours saved. **No manual status, no spreadsheet.**

Tests in minutes, no code

Record in Chrome, or generate tests from a URL, a user story, curl, Postman, OpenAPI or Jira stories. Reviewed and approved by your team.

Test data built in

Data-driven runs from CSV, Excel and JSON, plus data generators. One flow tested against many data sets, with seeds you can replay.

Cross-browser, CI ready

Chromium, Firefox and WebKit in parallel, from the web app, the CLI or any pipeline, with a pass/fail gate for your releases.

Secure and in your control

Each organization isolated, role-based access, locked and encrypted credentials, every agent action logged, and one switch to turn agents off.

Live today, in beta. Everything in this overview runs in production now. Agents suggest and you approve, Autofix is opt-in, and a security questionnaire is available on request.

START IN MINUTES

Free during the beta. No credit card.

Beta founders lock in 40% off any paid plan for the first year, with a free founder-led onboarding session. A good first step is a short pilot on one real project. Planned plans start at $49 per month per organization.
